## States of Quantum Geometry

#### States of Space:

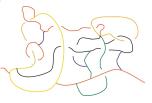

The kinematics of loop quantum gravity (Completing dynamics is homework.)

$$\mathcal{H}_{kin} = \bigoplus_{\Gamma} L^2 \left( SU(2)^L / SU(2)^{\mathcal{N}} \right)$$

The spin network basis,  $\mid \Gamma j_{l} \, i_{n} 
angle \in \mathcal{H}_{\mathit{kin}}$ , are labeled by

- a graph Γ,
- spins  $j_l$  on the L links l, and
- **intertwiners**  $i_n$  for each of the  $\mathcal{N}$  nodes n of the graph.

Intertwiners  $i_n$  have orthonormal basis labeled by a trivalent graph decomposition with spins labeling the virtual links.

## Granular Spatial Geometry

A hallmark of loop quantum gravity

With "geometric flux operator"  $L'_{l}$  and "metric operator"  $L_{l} \cdot L_{l'}$ ,

Area\*: 
$$\hat{A_S} \mid s \rangle = \sqrt{L_{I_S} \cdot L_{I_S}} \mid s \rangle = a \mid s \rangle$$

$$a = \ell_P^2 \sum_{n=1}^N \sqrt{j_n(j_n+1)}$$

**Angle**<sup>†</sup>: 
$$\hat{\theta}_{(12)} \mid s \rangle = \arccos \frac{L_1^i L_2^i}{|L_1| |L_2|} \mid s \rangle = \theta \mid s \rangle$$

$$\theta = \arccos\left(\frac{j_r(j_r+1) - j_1(j_1+1) - j_2(j_2+1)}{2[j_1(j_1+1)j_2(j_2+1)]^{1/2}}\right)$$

# Granular Spatial Geometry

#### Volume\*:

$$V_n \sim \sqrt{|\epsilon^{ijk}L_{l_1}^iL_{l_2}^jL_{l_3}^k|} \sim_{j o \infty} \ell_p^3 ( ext{total flux})^{3/2},$$

with scaling for the mean eigenvalue for large spin,

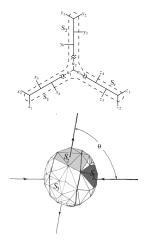

- Because of the angle and volume based at nodes, the node may be called an "atom of geometry".
- For large spin, an effective length  $\ell=\ell_p\sqrt{\text{total spin}}$  and an effective energy  $M=M_p/\sqrt{\text{total spin}}$
- How might the granularity of spatial geometry be observed?
   Observation would require a "lever arm".

<sup>\*</sup> Rovelli, Smolin Nuc. Phys. B 422 (1995) 593; Asktekar, Lewandowski Class. Quant. Grav. 14 (1997) A43

#### An Atom of Quantum Geometry

Idea: Use truncation of  $\mathcal{H}_{kin}$  to a single N-valent spin network node

- Can have non-vanishing volume and angle
- Geometric atom have an orthonormal basis, the intertwiners i<sub>n</sub> that label the ways to add spins
- Has dual picture of (fuzzy) convex polyhedra with N external faces\*

<sup>\*</sup> Bianchi et.al. Phys. Rev. D 83 (2011) 044035 arXiv: 1009.3402

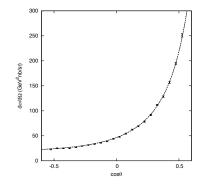

How might discrete spatial geometry be observed?

• Bhabha scattering  $(e^-e^+ \rightarrow e^-e^+)$ : The pure QED differential cross section for the process at lowest order is

$$s\left(\frac{d\sigma}{d\Omega}\right)_{\rm QED} = \frac{\alpha^2}{4} \frac{(3+\cos^2\theta)^2}{(1-\cos\theta)^2}$$

s is the square of the center of mass energy.

 In quantum geometry, scattering also measures cosine angle.

Center-of-mass energy has a corresponding length scale of  $\ell$ . Effective geometry at this scale supports measured angles in cross section What does a model of discrete geometry at this scale predict?

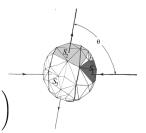

Angle operator

$$\hat{\theta}_{(12)} := \arccos \frac{L_1^i L_2^i}{|L_1| \, |L_2|}$$

• Spectrum

$$\hat{\theta}_{(12)} \mid j_1 j_2 j_3 \rangle = \theta_{(12)} \mid j_1 j_2 j_3 \rangle$$
 with

$$\theta_{(12)} = \arccos\left(\frac{j_3(j_3+1) - j_1(j_1+1) - j_2(j_2+1)}{2[j_1(j_1+1)j_2(j_2+1)]^{1/2}}\right)$$

will use n = 2j.

Non-uniform spectrum so it is hard to model continuum angles.
 This is the reason for the combinatorial lever arm that increases effective scale.

SAM Class. Quant. Grav. 16 (1999) 3859 arXiv: gr-qc/9905019

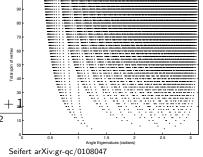

Angle operator

$$\hat{\theta}_{(12)} := \arccos \frac{L_1^i L_2^i}{|L_1| \, |L_2|}$$

Spectrum

• Spectrum 
$$\hat{\theta}_{(12)} \mid j_1 j_2 j_3 \rangle = \theta_{(12)} \mid j_1 j_2 j_3 \rangle \text{ with }$$

$$\theta_{(12)} = \arccos \left( \frac{j_3 (j_3 + 1) - j_1 (j_1 + 1) - j_2 (j_2 + 1)}{2 \left[ j_1 (j_1 + 1) j_2 (j_2 + 1) \right]^{1/2}} \right)$$

will use n = 2i.

 Non-uniform spectrum so it is hard to model continuum angles. This is the reason for the combinatorial lever arm that increases effective scale.

SAM Class. Quant. Grav. 16 (1999) 3859 arXiv: gr-qc/9905019

Model of atom of geometry assumptions:

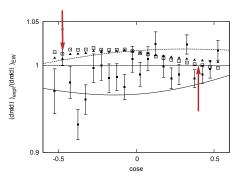

- With "large" length scale we have large spins, external face areas, and mescopic volume.
- Large, "semi-classical spins"  $1 \ll j_i \ll j_3$ , i=1,2. Characterized by "shape parameter"  $\epsilon = \sqrt{j_1 j_2/j_3}$ . With small  $\epsilon$  can accurately model continuum angle
- Simple and monochromatic: j = 1/2 for all incident edge labels
- Uniform probability distribution on intertwiners  $i_{\nu}$
- The 'shape' of the local geometry of space is altered by the combinatorics of the atom.

The model exhibits a systematic shift in the shape of geometry and angular measurements.

### Bhabha Scattering: A Gedanken experiment

Shape corrected cross section has a correction of the form at lowest order

$$\left(\frac{d\sigma}{d\Omega}\right)/\left(\frac{d\sigma}{d\Omega}\right)_{QED} = 1 \mp \left(\frac{3s}{\Lambda_{\pm}^2}\right) \left(\frac{\sin^2\theta}{3+\cos^2\theta}\right) \left(1+\frac{8}{\pi}\cos(\theta)\epsilon+\dots\right)$$

corrections for  $\epsilon = 5 \times 10^{-3}$ 

Derrick et. al. Phys. Rev. D 34 (1986) 3286; SAM 1005.5460

## Coherent states for an Atom of Geometry

Is this effect an artifact of the assumptions on the state of the atom?

- Coherent states. The semi-coherent states of Levine and Speziale are group averaged states  $|\underline{j}\underline{\hat{n}}\rangle$  constructed from N SU(2) coherent states (or face areas) and directions  $\underline{\hat{n}}$ .
- Angles between face normals are classical

$$\frac{\langle \underline{j}\underline{\hat{n}} \mid \cos\theta_{ij} \mid \underline{j}\underline{\hat{n}} \rangle}{\langle \underline{j}\underline{\hat{n}} \mid \underline{j}\underline{\hat{n}} \rangle} \simeq \hat{n}_i \cdot \hat{n}_j$$

at only moderate spins, e.g.  $j\sim 100$ .

 Form classical (oriented) convex polyhedra with N (fixed) faces at moderate spin.

So these coherent states states exhibit **no lever arm**. But the **directions are classical, arbitrary inputs**.

Livine and Speziale Phys. Rev. **D 76** (2007) 084028 arXiv:0705.0674

#### Geometric atoms from Combinatorics

Penrose's Goal: "build up physical theory from discreteness ... from combinatorial principles"

Spin Geometry Theorem (Penrose Moussouris) The scalar products of spins acting on a correlated state of spins (an atom of geometry) gives vectors in 3D Euclidean space, as long as the (relative) uncertainty of the scalar products is small.

- Can we obtain classical directions from only the quantum state of the atom? Yes! The spin geometry theorem is constructive by minimizing the relative uncertainties of  $\cos\theta$  we can derive normals in 3D from pure combinatorics.
- Do these states exhibit a lever arm?

Penrose, "Angular momentum: An approach to combinatorial spacetime" in *Quantum Theory and Beyond* T. Bastin

Moussouris, "Quantum Models as Space-time Based on Recoupling Theory" D.Phil. Thesis, Oxford University, Oxford, 1983.

#### Geometric atoms from Combinatorics

#### Apparently, Yes!

Numerical work on simplest "hydrogen atom of geometry", the tetrahedron.

- For equal area faces we used the spin geometry theorem algorithm to determine normals.
- Linear combination of states with amplitudes given by a complex Gaussian f(j)
- Minimizing the relative uncertainties

$$\frac{\langle \Delta(\vec{J}_2\cdot\vec{J}_3)\rangle}{j_2j_3}<\delta$$

based on peak, width and phase using

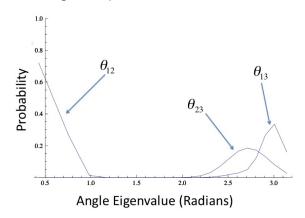

$$\delta^2 > \frac{1}{j_r^4} \left( \sum_{j_{23}}^{2j_r} \sum_{j_{12}}^{2j_r} \sum_{j_{12}'}^{2j_r} (j_{23}(j_{23}+1) - 2j_r(j_r+1))^2 f^*(j_{12}) \text{dim} \\ j_{12} \text{dim} \\ j_{23} \left\{ \begin{array}{ccc} j_1 & j_2 & j_{12} \\ j_3 & j_4 & j_{23} \end{array} \right\} \left\{ \begin{array}{ccc} j_1 & j_2 & j_{23} \\ j_3 & j_4 & j_{23} \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_{23} \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_2 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_2 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_2 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_2 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_2 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_2 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_2 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_2 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_2 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_2 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_2 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_2 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3 & j_4 & j_3 \end{array} \right\} f(j_1') - \frac{1}{j_2} \left\{ \begin{array}{ccc} j_1 & j_2 & j_3 \\ j_3$$

$$(\sum_{j_{23}}^{2j_r}\sum_{j_{12}}^{2j_r}\sum_{j_{1'2}}^{2j_r}(j_{23}(j_{23}+1)-2j_r(j_r+1))f^*(j_{12})\mathsf{dim}j_{12}\mathsf{dim}j_{23}\left\{\begin{array}{ccc} j_1 & j_2 & j_{12} \\ j_3 & j_4 & j_{23} \end{array}\right\}\left\{\begin{array}{ccc} j_1 & j_2 & j_{23} \\ j_3 & j_4 & j_{12}' \end{array}\right\}f(j_{12}')^2)$$

we computed the distribution of possible angles.

#### Geometric atoms from Combinatorics

Minimizing relative uncertainties favors squashed geometries with  $\theta \sim 0, \pi$ , indicating a the presence of a lever arm.

### Summary

- Observing Planck scale effects requires lever arm
- An atom of geometry used as model for physical effects of LQG kinematics. Corrections of continuum spatial geometry could arise
- Combinatorics can play a role in quantum geometry phenomenology
- Spin geometry theorem and operational point of view suggests how to build up coherent states from only spins
- Apparently there is a lever arm in this approach.

#### Further work:

- Define these states for general N
- Determine extent of lever arm
- Develop the effective-geometry field theory
