Gravitational field of static and axially symmetric vacuum spacetimes is described by

$$ds^{2} = -e^{2\nu} dt^{2} + \rho^{2} e^{-2\nu} d\phi^{2} + e^{2\lambda - 2\nu} (d\rho^{2} + dz^{2}) , \qquad (1)$$

where t, ρ, ϕ, z are the Weyl cylindrical coordinates and $\nu(\rho, z), \lambda(\rho, z)$.

Vacuum Einstein equations then

$$\Delta \nu = 0 \tag{2}$$

$$\lambda_{,\rho} = \rho(\nu_{,\rho}^2 - \nu_{,z}^2) \tag{3}$$

$$\lambda_{,z} = 2\rho\nu_{,\rho}\nu_{,z} \,, \tag{4}$$

where

- Δ is 3D Laplace operator in cylindrical coordinates (ρ, z)
- $\bullet~\lambda$ is integrated along some path through the vacuum region

Multiple sources in GR

Consider two distinct solutions, described by ν_1 , ν_2 , and λ_1 , λ_2 respectively

Their common gravitational field is given by

$$\nu = \nu_1 + \nu_2 \,, \tag{5}$$

$$\lambda = \lambda_1 + \lambda_2 + \lambda_{int} \,, \tag{6}$$

where λ_{int} satisfies

$$\lambda_{\text{int},\rho} = 2\rho(\nu_{\text{Schw},\rho}\nu_{\text{disk},\rho} - \nu_{\text{Schw},z}\nu_{\text{disk},z}),$$

$$\lambda_{\text{int},z} = 2\rho(\nu_{\text{Schw},\rho}\nu_{\text{disk},z} + \nu_{\text{Schw},z}\nu_{\text{disk},\rho}).$$

SBH+disk model

We wish to study a Schwarzschild black hole described by

$$\nu_{\rm Schw} = \frac{1}{2} \ln \left(\frac{R_+ + R_- - 2M}{R_+ + R_- + 2M} \right) , \qquad (9)$$

$$\lambda_{\rm Schw} = \frac{1}{2} \ln \left[\frac{(R_+ + R_-)^2 - 4M^2}{4R_+ R_-} \right] , \qquad (10)$$

where

$$R_{\pm} = \sqrt{\rho^2 + (|z| \mp M)^2}, \qquad (11)$$

encircled by a thin disc with a convenient density profile.

Vogt-Letelier disks

In Kotlařík and Kofroň (2022), we found

- a family of thin disks; potential first considered by Vogt and Letelier (2009)
- metric in closed-forms
- \bullet including analytical expressions for $\lambda_{\text{int}},$ when superposed with the black hole

density
$$\propto \frac{\mathcal{M}b^{2m+1}\rho^{2n}}{(\rho^2+b^2)^{m+n+3/2}}, \quad m,n \in \mathbb{N}_0,$$
 (12)
 $\nu_{\mathsf{D}}^{(m,n)} = -(2m+1)\binom{m+n+1/2}{n}\mathcal{M}\sum_{j=0}^{m+n}\mathcal{Q}_j^{(m,n)}\frac{b^j}{r_b^{j+1}}P_j(|\cos\theta_b|),$ (13)
 $r_b^2 \equiv \rho^2 + (|z|+b)^2, \quad |\cos\theta_b| \equiv \frac{|z|+b}{r_b},$ (14)

where $\mathcal{Q}_j^{(m,n)}$ are constants, P_j are Legendre polynomials, and \mathcal{M} is the total mass of the disk.

Vogt-Letelier disks

Petr Kotlařík Quasinormal modes of black holes encircled by a gravitating thin disk

How do QNMs propagates in the SBH+disk spacetime?

We take a simpler task and study QNMs of a massless scalar field ψ .

The QNMs are governed by the massless Klein-Gordon equation

$$\Box \psi = 0 . \tag{15}$$

In the Schwarzschild coordinates

$$\rho = \sqrt{r(r-2M)} \sin \theta , \qquad z = (r-M) \cos \theta , \qquad (16)$$

the wave equation is separable on the Schwarzschild background.

The scalar field can be decomposed into spherical harmonics

$$\psi_{\omega}(r,\theta,\phi) = \sum_{m_z=-\infty}^{\infty} \sum_{\ell=|m_z|}^{\infty} \frac{\psi_{\omega\ell m_z}(r)}{r} Y_{\ell m_z}(\theta,\phi), \qquad (19)$$

which leads into a single radial equation for each mode

$$\frac{\mathrm{d}^2\psi_{\omega\ell m_z}}{\mathrm{d}r_*^2} + \left[\omega^2 - V_{\mathrm{eff}}(r)\right]\psi_{\omega\ell m_z} = 0\,,\tag{20}$$

where $dr_* = f^{-1}(r) dr$ and

$$V_{\rm eff}(r) = rac{f(r)f'(r)}{r} + rac{\ell(\ell+1)f}{r^2}, \quad f'(r) \equiv rac{{
m d}f}{{
m d}r}.$$
 (21)

Petr Kotlařík Quasinormal modes of black holes encircled by a gravitating thin disk

Cano, Fransen, and Hertog (2020): "almost separable" systems

A Schwarzschild black hole perturbed by a small deformation (gravitating light disk).

Denote $\epsilon = \mathcal{M}/M$ and expand the operator into the separable part plus first order corrections

$$\mathcal{D}_{\omega}^{2} = \mathcal{D}_{(0)\omega}^{2} + \epsilon \mathcal{D}_{(1)\omega}^{2} \,. \tag{22}$$

Э

$$\mathcal{D}_{\omega}^{2} = \mathcal{D}_{(0)\omega}^{2} + \epsilon \mathcal{D}_{(1)\omega}^{2} \,. \tag{22}$$

$$\mathcal{D}_{\omega}^{2} = \mathcal{D}_{(0)\omega}^{2} + \epsilon \mathcal{D}_{(1)\omega}^{2} .$$

$$\psi_{\omega}(\mathbf{r}, \theta, \phi) = \sum_{m_{z}=-\infty}^{\infty} \sum_{\ell=-|m_{z}|}^{\infty} \psi_{\omega\ell m_{z}}(\mathbf{r}) Y_{\ell m_{z}}(\theta, \phi) ,$$
(23)

The radial and angular equations are not decoupled.

However, we can separate the solution of ${\cal D}^2_{(0)\omega}\psi_\omega(r, heta,\phi)$ for a certain $\ell=\ell_0,m_z=m_0$ and consistently assume

$$\psi_{\omega}(r,\theta,\phi) = \psi_{\omega\ell_0m_0}(r)Y_{\ell_0m_0}(\theta,\phi) + \epsilon \sum_{\substack{m_z = -\infty \\ m_z \neq m_0}}^{\infty} \sum_{\substack{\ell = -|m_z| \\ \ell \neq \ell_0}}^{\infty} \psi_{\omega\ell m_z}(r)Y_{\ell m_z}(\theta,\phi) \,.$$
(25)

Petr Kotlařík Quasinormal modes of black holes encircled by a gravitating thin disk

・ロト ・ 同ト ・ ヨト ・ ヨト - ヨー

$$\mathcal{D}_{\omega}^{2} = \mathcal{D}_{(0)\omega}^{2} + \epsilon \mathcal{D}_{(1)\omega}^{2} .$$

$$\psi_{\omega}(\mathbf{r}, \theta, \phi) = \sum_{m_{z}=-\infty}^{\infty} \sum_{\ell=-|m_{z}|}^{\infty} \psi_{\omega\ell m_{z}}(\mathbf{r}) Y_{\ell m_{z}}(\theta, \phi) ,$$
(23)

The radial and angular equations are not decoupled.

However, we can separate the solution of $\mathcal{D}^2_{(0)\omega}\psi_\omega(r,\theta,\phi)$ for a certain $\ell = \ell_0, m_z = m_0$ and consistently assume

$$\psi_{\omega}(r,\theta,\phi) = \psi_{\omega\ell_0m_0}(r)Y_{\ell_0m_0}(\theta,\phi) + \epsilon \sum_{\substack{m_z = -\infty \\ m_z \neq m_0}}^{\infty} \sum_{\substack{\ell = -|m_z| \\ \ell \neq \ell_0}}^{\infty} \psi_{\omega\ell m_z}(r)Y_{\ell m_z}(\theta,\phi).$$
(25)

Petr Kotlařík Quasinormal modes of black holes encircled by a gravitating thin disk

Thus

$$\mathcal{D}_{\omega}^{2}\psi_{\omega}(r,\theta,\phi) = \left[\mathcal{D}_{(0)\omega}^{2} + \epsilon \mathcal{D}_{(1)\omega}^{2}\right]\psi_{\omega\ell_{0}m_{0}}(r)Y_{\ell_{0}m_{0}}(\theta,\phi) + \epsilon \sum_{\substack{m_{z}=-\infty\\ \ell\neq\ell_{0}}}^{\infty}\sum_{\substack{\ell=-|m_{z}|\\ \ell\neq\ell_{0}}}^{\infty}\mathcal{D}_{(0)\omega}^{2}\psi_{\omega\ell_{m_{z}}}(r)Y_{\ell_{m_{z}}}(\theta,\phi) + \mathcal{O}(\epsilon^{2}).$$
(26)

and using the orthogonality of the spherical harmonics, the last term is projected out

$$\int_{0}^{2\pi} \int_{0}^{\pi} Y_{\ell_{0}m_{0}}^{*} \mathcal{D}_{\omega}^{2} \psi_{\omega}(r,\theta,\phi) \sin\theta \,\mathrm{d}\theta \,\mathrm{d}\phi =$$
$$= \int_{0}^{2\pi} \int_{0}^{\pi} Y_{\ell_{0}m_{0}}^{*} \left[\mathcal{D}_{(0)\omega}^{2} + \epsilon \mathcal{D}_{(1)\omega}^{2} \right] \psi_{\omega\ell_{0}m_{0}}(r) Y_{\ell_{0}m_{0}}(\theta,\phi) \sin\theta \,\mathrm{d}\theta \,\mathrm{d}\phi \,. \tag{27}$$

Petr Kotlařík Quasinormal modes of black holes encircled by a gravitating thin disk

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○ < ○

Performing the integration leads again to the radial equation

$$\frac{\mathrm{d}^2\Psi_{\omega\ell m_z}}{\mathrm{d}r_*^2} + \left[\omega^2 - V_{\mathrm{eff}}(r)\right]\Psi_{\omega\ell m_z} = 0\,, \tag{28}$$

with the appropriately modified tortoise coordinate r_* , and

$$V_{\rm eff}(r) = V_{\rm eff}^{\rm Sch}(r) + \epsilon V_{\rm eff}^{\rm corr}(r) \,. \tag{29}$$

Brief summary

- $\bullet~\ensuremath{\mathsf{QNMs}}$ of a scalar field propagating in the SBH+disk background
- the effective potential is flattened by the presence of the disk
- QNMs are shifted towards the same direction in the complex plane
- hint of a universal behaviour
- it might help to disentangle environmental effects from those induced by quantum corrections
